

Think Before You Share. Security Info Doesn't Belong on LinkedIn!

Excited to share that we just finished a major upgrade to our internal firewall system at GlobalTech! It was a tough challenge, but our team managed to implement a new VPN protocol and switch to a more secure encryption standard.

For those wondering, we moved away from our old FortiGate setup and are now using Cisco Adaptive Security Appliances (ASA)—way more robust! If you're in IT, you'll know what a game-changer this is. Funny story: last week, our SOC (Security Operations Center) got hit with a massive wave of phishing attempts, but thanks to our new intrusion detection updates, we managed to block them before they did any damage. If you're an IT admin, definitely make sure your internal security patches are up to date!

Oversharing security details makes your company a target for hackers.
